

1 **ABSTRACT**

2 A script file includes a text section that has a text label to designate a point  
3 during execution of the script sequence when an audio rendition of a video event is  
4 to be initiated. The script file also includes a container that maintains audio  
5 content within the script file. The audio content is identified in the container with  
6 a content label that corresponds to a text label in the text section. The audio  
7 content is initiated to be generated as the audio rendition at the designated point  
8 during execution of the script sequence when the script file is executed and when a  
9 script processor determines that the content label corresponds to the text label.
